

**Pressure and
Temperature
Control**

Pressure and Temperature Controls

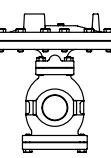

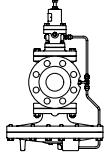

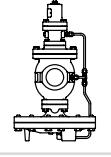

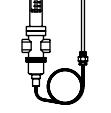

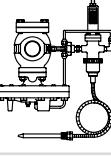

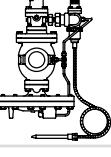

Armstrong pressure reducing valves (PRVs) and temperature regulators help you manage steam, air and liquid systems safely and efficiently. They assure also uninterrupted productivity - by maintaining constant pressure or temperature for process control. In short, Armstrong regulators make using resources safe and productive... as well as environmentally sound.

For decades, Armstrong has devoted itself to learning - and sharing - all it can about energy conservation as it relates to steam equipment. As part of our product/service network, PRVs and temperature regulators represent expanded options for a reliable Armstrong solution.

All models comply with the Pressure Equipment Directive PED 2014/68/UE. For details, see specific product page or Armstrong PED Certificate.

Pressure Reducing Valves

PRV Types

Steam, liquids and gases usually flow at high pressures to the points of final use. At these points, a pressure reducing valve lowers the pressure for safety and efficiency and to match the requirements of the application. There are two types of pressure reducing valves offered by Armstrong:

Direct Acting. The simplest of PRVs, the direct acting type operates with convoluted bellows. Since it is self-contained, it does not need an external sensing line downstream to operate. It is the smallest and most economical of the two types and is designed for low to moderate flows. Accuracy of direct acting PRVs is typically $\pm 10\%$ of the downstream set point.

Externally Piloted. This type of PRV incorporates two valves - a pilot and a main valve - in one unit. The pilot valve has a design similar to the direct acting valve. The discharge from the pilot valve acts on a set of double diaphragms, which controls through a piston the opening of the main valve. This high diaphragm area can open a larger main valve, allowing a greater capacity per line size than the direct acting regulators. In addition, the diaphragms are more sensitive to pressure changes, and that means accuracy of $\pm 1\%$. This greater accuracy is also due to the location of the sensing line outside of the valve, where there is less turbulence. This valve also offers the flexibility to use different types of pilot valves: pressure, temperature, air loaded, solenoid or combinations.

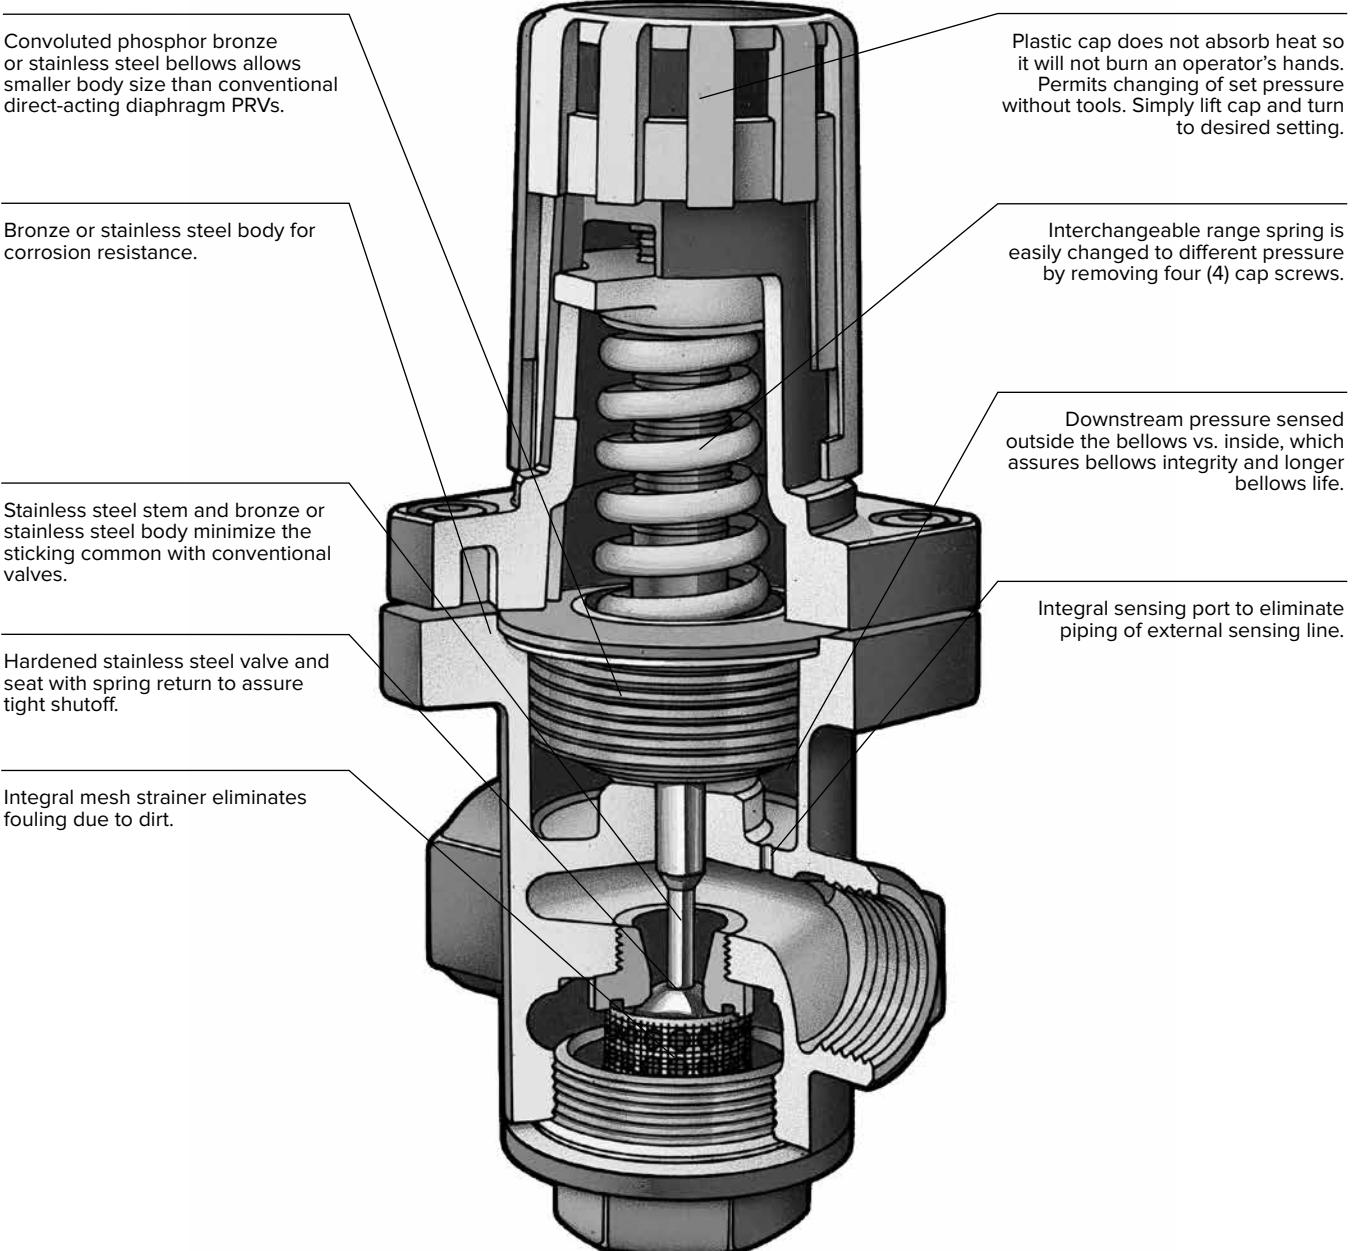

Direct Acting

For Steam, Air and Non-Corrosive Gas Service

The simplest of all pressure reducing valves, the direct acting type operates with convoluted bellows. Since it is self-contained, it does not need an external sensing line downstream to operate.

It is the smallest and most economical of the two types and is designed for low to moderate flows. Accuracy of direct acting PRVs is typically $\pm 10\%$.

Armstrong® GD-30/30S

For Steam, Air and Non-Corrosive Gases

The GD-30 is a compact, high performance direct acting valve. Economical to buy and use, it's ideal for those low to moderate flow applications where accuracy of $\pm 10\%$ is acceptable.

The GD-30 is well suited for laundry and dry cleaning equipment, hospital equipment, tire molds, humidifiers, small heaters and applications in food processing. It provides tight shutoff for dead-end service on steam.

Table PTC-266-1. GD-30 Specifications

Application	Inlet Pressure (barg)	Reduced Pressure (barg)	Spring color	Minimum Differential (barg)	Maximum Temperature (°C)	Materials		
						Body	Valve/Seat	Bel lows
Steam Air Non-corrosive gases	1 - 17	0,2 - 1,0	Yellow	0,5	210	Cast Bronze ASTM B584	Stainless Steel AISI 440/304	Phosphor Bronze*
		0,5 - 4,0	Blue					
		3,5 - 10,0	Green					

* Stainless steel optional.

Note : For air capacities in Nm³/h, multiply steam capacities by 1,2.

Maximum pressure reduction ratio 10:1.

Shade indicates capacities available with bronze GD-30 only.

GD-2000K

Air Loaded Valves for Steam

The GD-2000K is an ideal choice when set point changes are frequent, access to the valve is difficult and steam quality is poor. The GD-2000K comes with either BSPT or flanged connections for quick, easy installation.

It also comes with a durable ductile iron body and features double stainless steel diaphragms and hardened stainless working parts, renewable in-line. High Cv and 10:1 turndown ratio. Single seated for dead-end service.

Table PTC-268-1. GD-2000K Specifications

Application	Inlet Pressure (barg)	Reduced Pressure (barg)	Maximum Temperature (°C)	Minimum Differential (barg)	Materials

100 - 4"	—	350	167	488	401	—	112	120,0

* All sizes comply with the article 4.3 of the PED (2014/68/UE), but PMA for DN65 is 15 bar, for DN80: 12,5 bar and for DN100: 10 bar.

For capacities see page PTC-273.

External Sensing Line is not included as standard, but could be delivered on request. Internal Sensing Kit is also available.

GD-2000K

All dimensions and weights are approximate. Use certified print for exact dimensions. Design and materials are subject to change without notice.

Notes

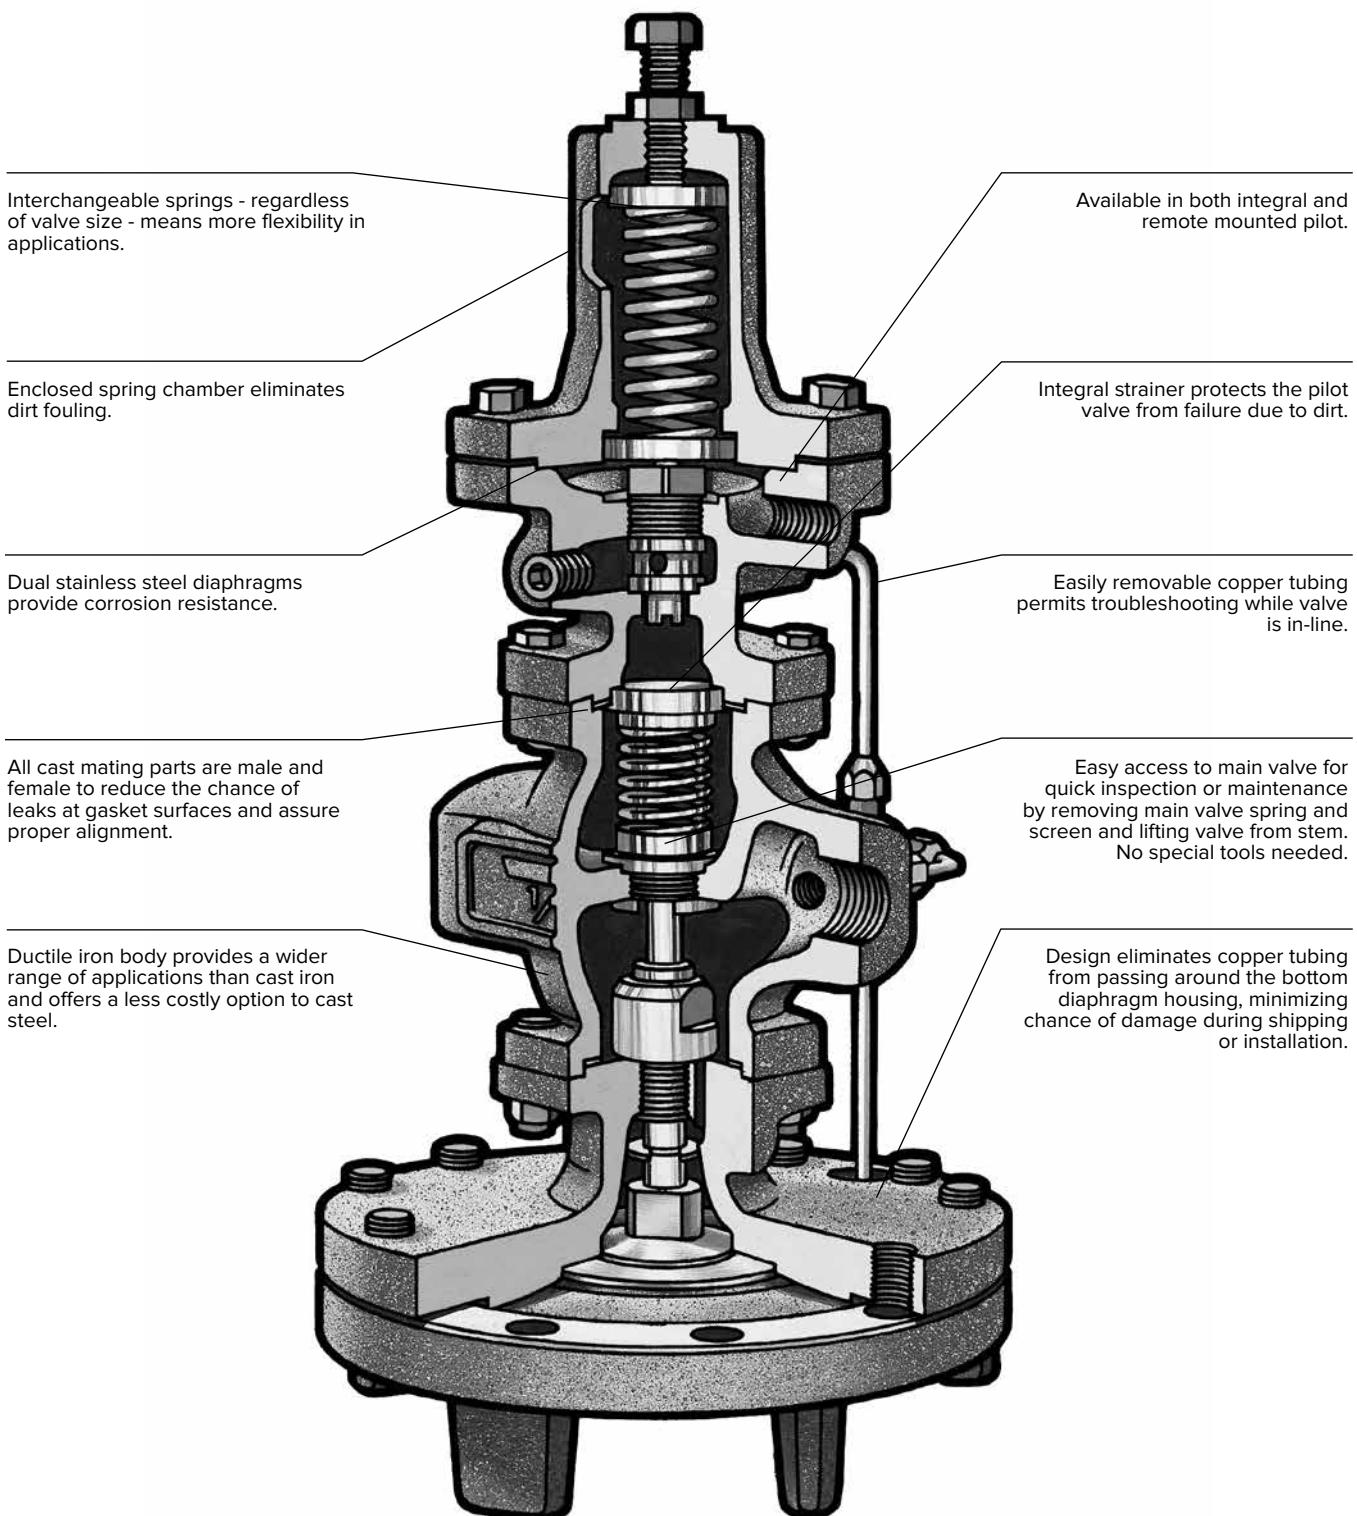

Externally Piloted

For Steam Service

This type of PRV incorporates two valves - a pilot and a main valve - in one unit. The pilot valve has a design similar to the direct acting valve. The discharge from the pilot valve acts on a set of double diaphragms, which controls through a piston the opening of the main valve. This increased diaphragm area can open a larger main valve, allowing a greater capacity per line size than the internally piloted piston-operated valve.

In addition, the diaphragms are more sensitive to pressure changes, which results in accuracy of $\pm 1\%$. This greater accuracy is due also to the positioning of the sensing line downstream, where there is less turbulence. This valve also offers the flexibility to use different types of pilot valves: pressure, temperature, air loaded, solenoid or combination.

For Steam Service

The GP-2000 is a high performance, externally piloted reducing valve for large capacity requirements. Typical use is on intermittent service, including applications such as heat exchangers, steam coils, rotating dryers, process equipment and heating systems.

With a 20:1 rangeability and high Cv, the GP-2000 is reliable and accurate ($\pm 1\%$ of pressure set point from 5% to 100% of flow) over a long, trouble-free service life. Hardened stainless steel working parts are renewable in-line. Single seated for dead-end service. Available with both BSPT (1/2" - 2") and flanged connections in DN15 - DN150 sizes.

Table PTC-271-1. GP-2000 Specifications

Application	Inlet Pressure (barg)	Reduced Pressure (barg)	Spring Color	Maximum Temperature (°C)	Minimum Differential (barg)	Materials				
						Body	Main Valve /Seat	Pilot Valve / Seat	Diaphragm	Color
Steam	1 - 20	0,1 - 0,2*	Yellow	232	0,5	Ductile Iron ASTM A536	Stainless Steel AISI 420	Stainless Steel AISI 301	Dark Gray	
		0,2 - 1,5	Yellow							
		1 - 14	Green							

* Note: When using this spring range, remove one (1) pilot diaphragm. Capacities are reduced by 1/2 of capacity chart when this spring is being used.

GP-2000R

For Steam Back Pressure Regulation

The GP-2000R is a high performance externally piloted throttling back pressure valve for large capacity applications. Typical applications would include those systems utilizing flash steam for low pressure heating or processes.

The GP-2000R valves will function to maintain a constant upstream pressure. This valve is not a safety valve and should not be used for that purpose.

Table PTC-272-1. GP-2000R Specifications

Application	Inlet Pressure (barg)	Reduced Pressure (barg)	Spring Color	Maximum Temperature (°C)	Minimum Differential (barg)	Materials				
						Body	Main Valve / Seat	Pilot Valve / Seat	Diaphragm	Color

Note: Maximum pressure reduction 20:1, except for GD-2000K (10:1).
Minimum pressure reduction is 85% of inlet pressure.

Application Data - Pressure Reducing Valves

Direct Acting Single Stage Reduction

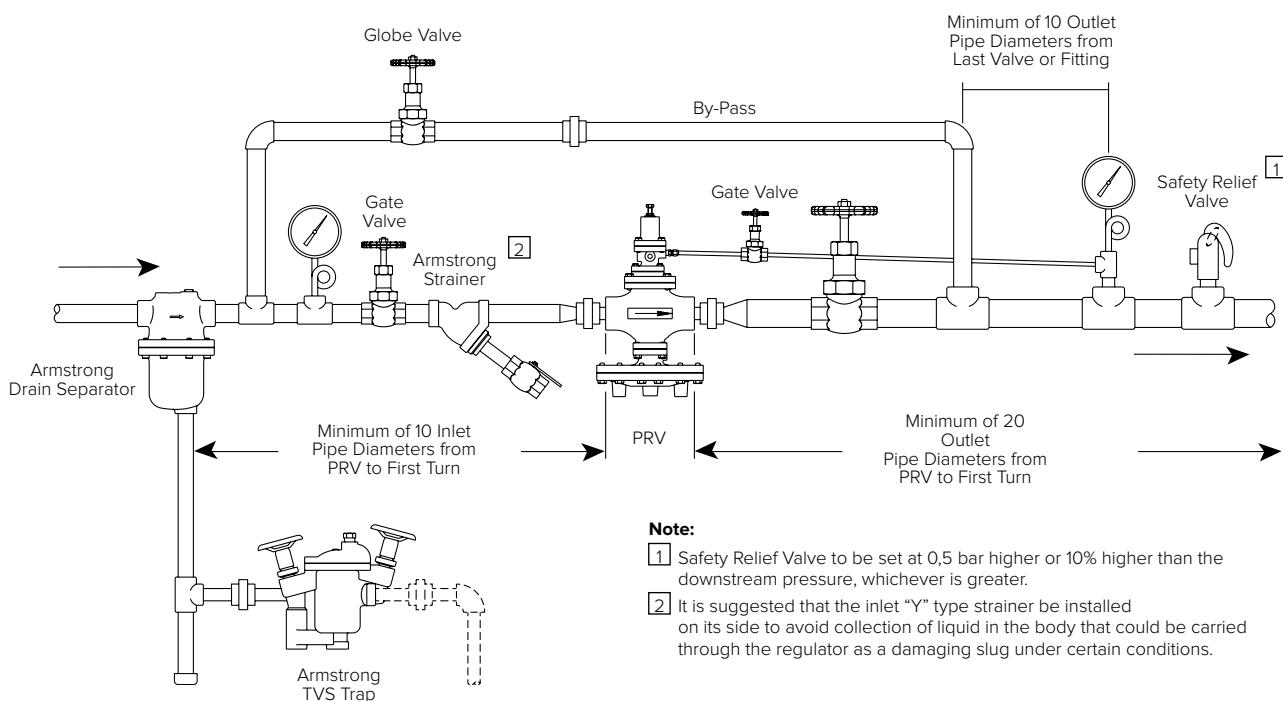

Note:

- [1] Safety Relief Valve to be set at 0,5 bar higher or 10% higher than the downstream pressure, whichever is greater.
- [2] It is suggested that the inlet "Y" type strainer be installed on its side to avoid collection of liquid in the body that could be carried through the regulator as a damaging slug under certain conditions.

Typical Direct Acting PRV Installation

External Pressure Pilot Single Stage Reduction

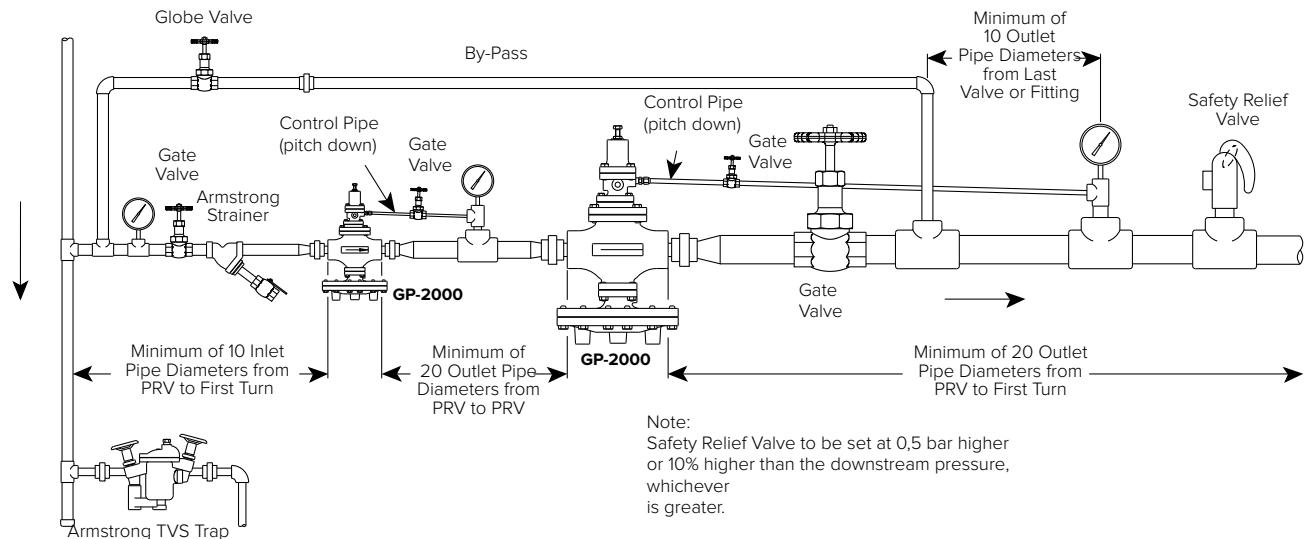

Note:

- [1] Safety Relief Valve to be set at 0,5 bar higher or 10% higher than the downstream pressure, whichever is greater.
- [2] It is suggested that the inlet "Y" type strainer be installed on its side to avoid collection of liquid in the body that could be carried through the regulator as a damaging slug under certain conditions.

Typical External Pressure Pilot PRV Installation

Application Data - Pressure Reducing Valves

External Pressure Pilot Two Stage Reduction

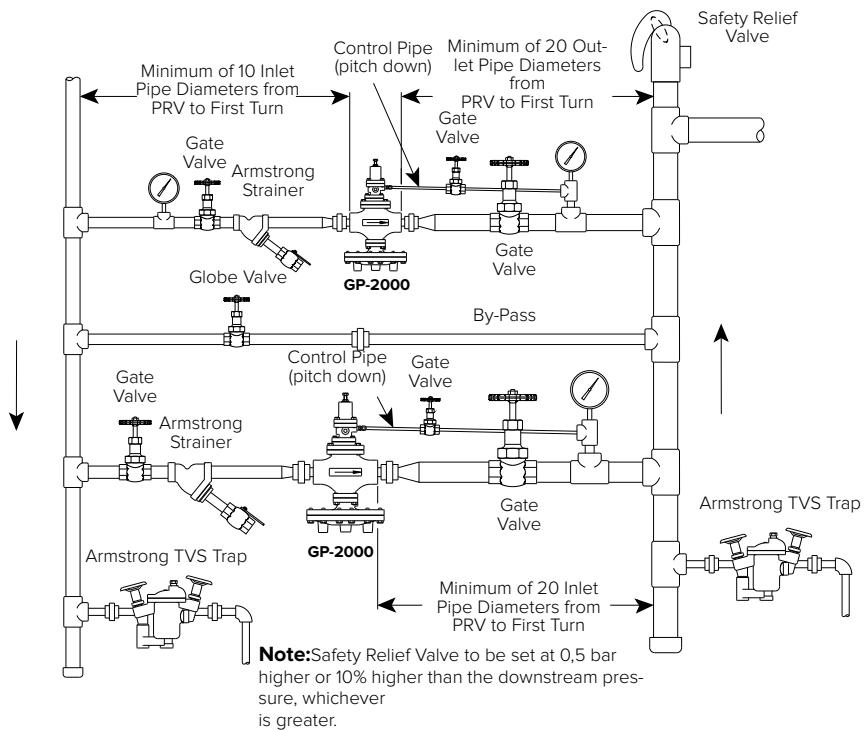

This piping application is used when the pressure turndown ratio is greater than that of a single valve. Pressure reduction is accomplished by using two valves in series to reduce the pressure in stages. Depending on the volume of fluid required and pressure reduction, the second stage valve typically will be larger in size than the first stage valve.

Unless a specific intermediate pressure of the fluid is required, this intermediate pressure is typically selected so as to keep the pressure turndown ratios of both valves as similar as possible. This will help equalize and maximize the service life of both valves.

External Pressure Pilot One-Third to Two-Third Reduction Station

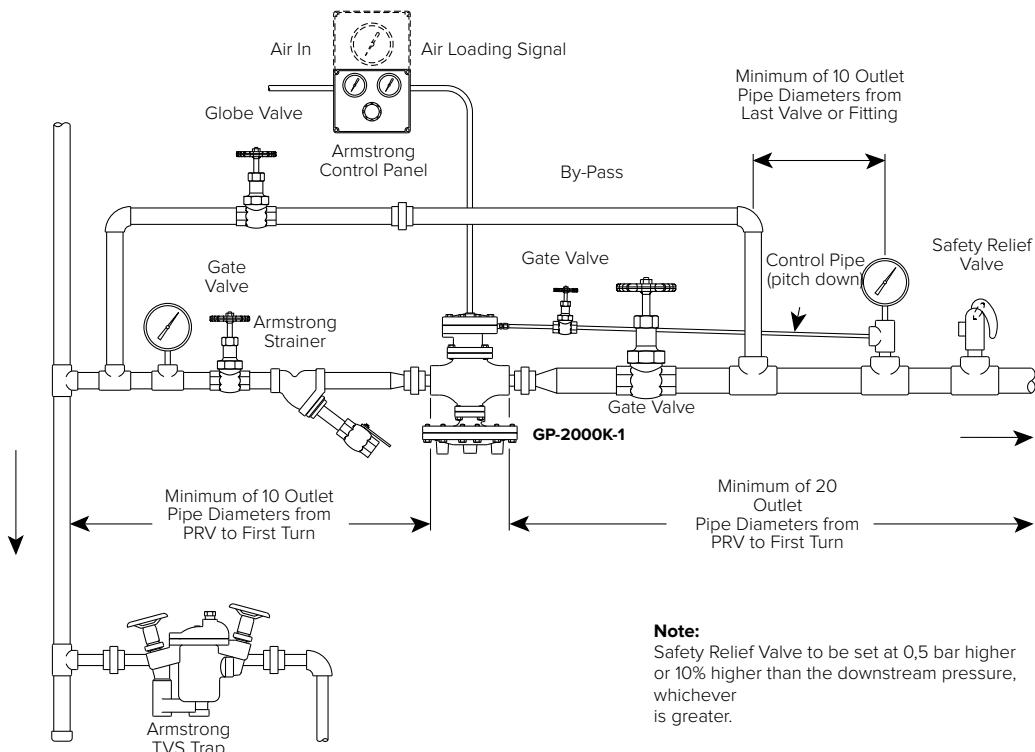

This piping application is used when the flow rangeability is greater than that of a single valve. Better control is achieved by piping two valves in parallel and sizing one to handle 1/3 the maximum load and the other 2/3 the maximum load. These two valves are staged by offsetting their pressure set points by 0,2 barg. The smaller valve is usually the lead valve and would have a pressure set point at the desired pressure. The larger valve is usually the lag valve and would have a pressure set point of 0,2 barg below the lead valve. This offset of set points will stage the valves so that the lag valve will remain closed until the lead valve can no longer pass the required flow and is wide open. This lack of flow will cause the set pressure to drop slightly until the lag valve opens and regulates at the higher demands of flow.

Application Data - Pressure Reducing Valves

Air Loaded External Pilot Single Stage Reduction

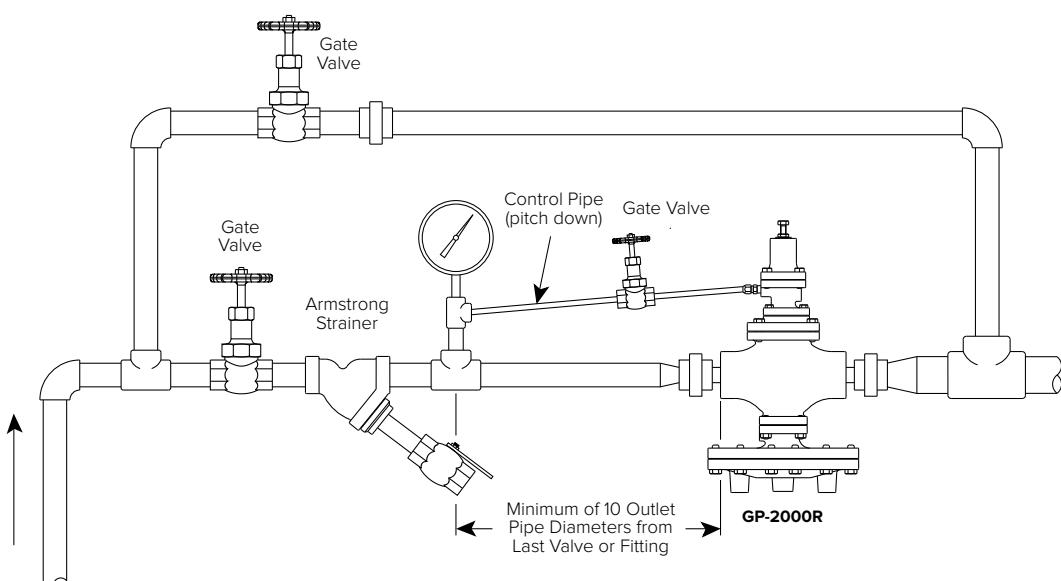

Note:

Safety Relief Valve to be set at 0,5 bar higher or 10% higher than the downstream pressure, whichever is greater.

Typical Air Loaded External Pilot Reduction Station. Complete with remote located air loading control panel.

External Back Pressure Pilot Installation

Typical External Pilot Back Pressure Installation. Used to maintain a constant upstream pressure in the piping system.

Note: 50% reduced ports are available for all 2000 Series - capacities and Cv are reduced by 50%

* GD-30 only

When ordering please specify:

1. Model number
2. Connection size and type
3. Quantity
4. Service fluid
5. Specific gravity (if other than steam, air, water)
6. Fluid temperature
7. Maximum inlet pressure
8. Desired reduced pressure or controlled temperature
9. Flow rate
10. Special conditions (if any)

Temperature Regulators

Temperature Regulators Types

Armstrong self-actuated temperature regulators are compact, high performance units that are simple in design and operation and suitable for a wide variety of applications. Features including flexible mounting positions, interchangeable capillaries and several temperature ranges make installation, adjustment and maintenance quick and easy.

There are three types of temperature regulators in Armstrong product range:

Low capacity : our **OB-30/31** temperature regulators are suitable for variety of heating or cooling applications. They can be used for steam, water and non-corrosive liquids. Available with connections up to 1", they can handle up to 750 kg/h of steam or 16 m³/h of water.

High capacity : our **OB-2000** temperature regulators are high capacity valves for steam applications. Used for heating only, they are able to handle up to 30 000 kg/h of steam.

Pressure and Temperature Regulators : our **OB-2000PT** temperature regulators have both pressure and temperature pilots, giving them higher accuracy. Being able to control as well outlet steam pressure as the temperature of the heated fluid, they can handle up to 30 000 kg/h of steam.

Temperature Regulators

For Steam, Water and Non-Corrosive Liquid Service

Armstrong self-actuated externally piloted temperature regulators are compact, high performance units that are simple in design and operation - and suitable for a wide variety of applications.

Features including flexible mounting positions of the sensor, interchangeable capillaries and varied temperature ranges make installation, adjustment and maintenance quick and easy.

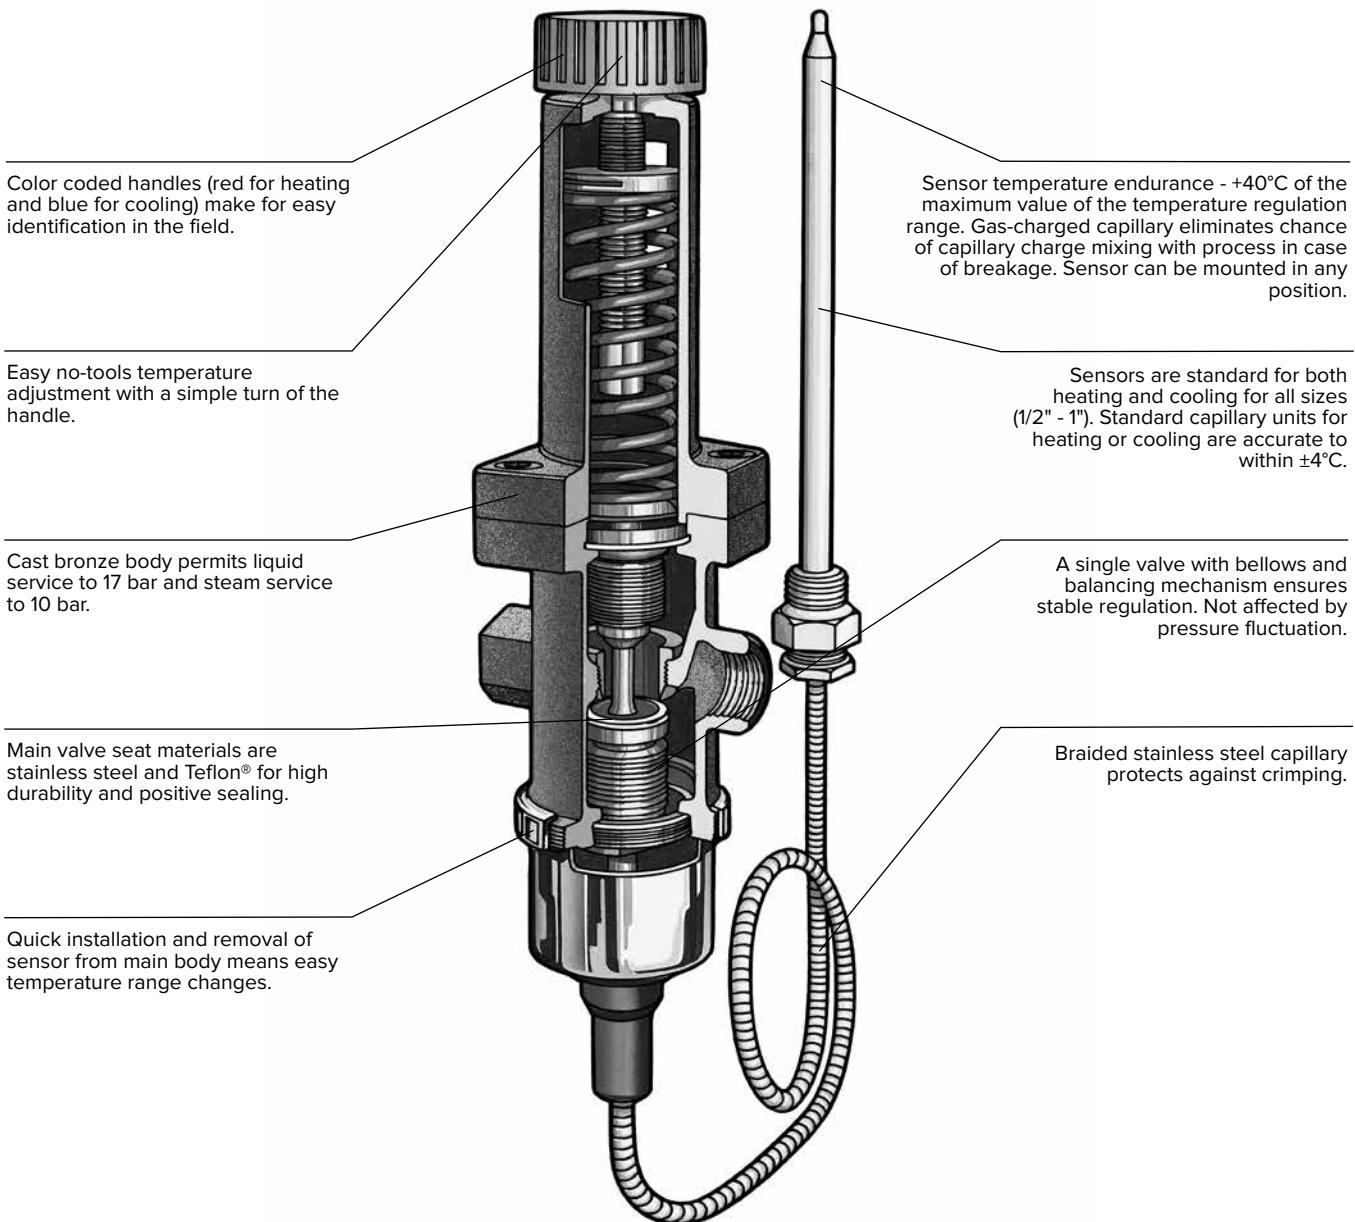

Table PTC-279-1. Temperature Regulator Valve Selection

If the Service is	If the Inlet Pressure is	Type of Control	Temperature Ratings (°C)	Temperature Accuracy (°C)	If Maximum Capacity is Less Than	Look for Model	Find on Page
Heating	1 - 10 barg	Self-Contained Direct Acting	0 - 150°C (5 ranges)	± 3°C	792 kg/h	OB-30	PTC-280
	0,5 - 20 barg	Self-Contained Pilot Operated	-8 - 183°C (6 ranges)	± 1°C	29 754 kg/h	OB-2000 OB-2000PT	PTC-282 PTC-284
Cooling	0,34 - 17 barg	Self-Contained Reverse Acting	0 - 150°C (5 ranges)	± 3°C	16 m³/h	OB-31	PTC-280

OB-30/31

For Steam, Water and Non-Corrosive Liquids

The Armstrong OB-30/31 is a direct acting temperature regulator that requires no external source for operation. Simple and compact, the unit is suitable for a wide variety of heating/cooling applications. Installing, adjusting or maintaining the OB-30/31 is quick and easy because interchangeable capillaries mount in any position and

disconnect by simply loosening the union nut. No stem packing so there's no leakage. Single composition seat for tight shutoff. The OB-30/31 comes in 1/2", 3/4" or 1" sizes and is available with a choice of five temperature ranges and three capillary lengths.

Table PTC-280-1. OB-30/31 Specifications

Model	Application	Service	Maximum Inlet Pressure (barg)	Maximum Differential (barg)	Temperature Ranges (°C)	Maximum Temperature (°C)	Temperature Accuracy (°C)	Capillary Lengths (m)
OB-30	Heating	Steam, Water	Steam: 10 barg	10	0 - 35	185	± 3 From Set Point	2 3 5*
					25 - 70			
					40 - 100			
					60 - 130			
					70 - 150			
OB-31	Cooling	Water, Non-Corrosive Liquids	Liquid: 17 barg					

* Standard length.

Note: Capillary can withstand a maximum of 40°C above rated range. If desired set temperature is in temperature range overlap, select lower range.

	6,90	417	519	654
	0 - 4,3	506	629	793

Note: Where it is not possible to calculate pressure drop, 35% - 40% of gauge supply pressure can be used as a reasonable approximation.

Temperature Regulator Selection Example
Parameters:

Fluid Steam
Maximum inlet pressure 7 bar
Outlet pressure 6 bar
Maximum flow rate 227 kg/h
Temperature required 82°C
Distance from regulator to sensing point 1,5 m

To Locate Proper Model:

Enter inlet column at 7 bar
Move to outlet pressure of 6 bar
Locate capacity of 227 kg/h under connection size 1"
Find capillary temperature range 25-70°C
Select capillary length 5 m

Application Will Require:

OB-30, 1" with 25-70°C Temperature Range,
Capillary Length 5m

Table PTC-281-2. OB-30/31 Capacities for water in l/mn

Differential Pressure (bar)	Connection Size		
	1/2"	3/4"	1"
0,35	15	20	25
0,70	30	38	47

60 - 130
70 - 150

Note: If desired set temperature is in temperature range overlap, select lower range.

OB-2000

For Steam

Armstrong's OB-2000 is a high performance externally piloted temperature regulator for large capacity applications such as heat exchangers, steam coils, steam dryers, plating tanks and parts washers. Self-actuated and requiring no external energy source, the OB-2000 comes with pilot valve and tubing pre-assembled.

Capillary units mount in any position and can be easily disconnected and interchanged, offering easy installation and maximum application flexibility. Available in sizes 1/2" through 4" with six temperature ranges and three capillary lengths.

Table PTC-282-1. OB-2000 Specifications

Application	Inlet Pressure (barg)	Minimum Differential Pressure (barg)	Temperature Ranges (°C)	Temperature Accuracy (°C)	Capillary Length (m)
Steam	0,5 - 20	0,5	-8 - 15	± 1 °C From Set Point	2
			10 - 36		
			30 - 62		
			55 - 94		3
			80 - 127		5*
			115 - 183		

* Standard length.

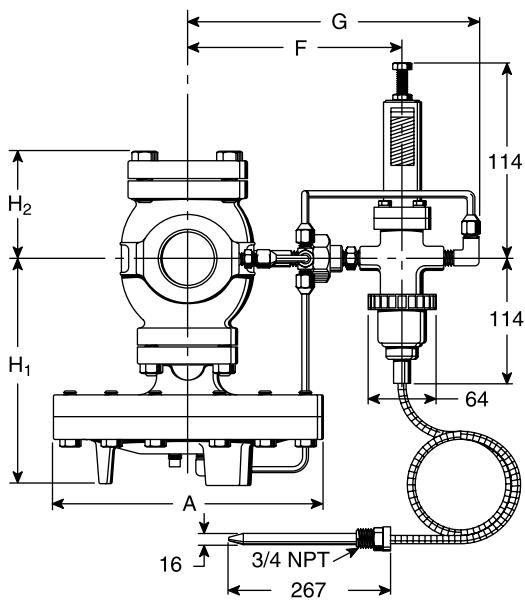

Note: If desired set temperature is in temperature range overlap, select lower range.

Shade indicates products that are CE Marked according to the PED (2014/68/UE). All the other sizes comply with the Article 4.3 of the same directive.

Note: DN150 valve is available on request, but **is not CE Marked**.

All dimensions and weights are approximate. Use certified print for exact dimensions. Design and materials are subject to change without notice.

OB-2000

Table PTC-283-1. Sensor and Accessory Specifications

CAPILLARY		BULB		THERMAL WELL	
Material	Temperature Range (°C)	Material	Connection	Material	Connection
Copper Capillary Tube with 304 Stainless Steel Armor Shield	-8 - 15	Nickel Plated Copper	3/4" NPT	Brass or 304 Stainless Steel*	1" BSPT
	10 - 36				
	30 - 62				
	55 - 94				
	80 - 127				
	115 - 183				

* Standard. Other material available upon request. See page PTC-280 for dimensional information.

Note: Capillary can withstand a maximum of 20°C above rated range. If desired set temperature is in temperature range overlap, select lower range.

Table PTC-283-2. OB-2000 Materials

OB-2000	Body	Seat	Valve	Connection	Maximum Temperature
Main Valve	Ductile Iron ASTM A536	Single Seat Stainless Steel AISI 420	Stainless Steel AISI 420	BSPT or Flanged PN 25/40	232°C
Temperature Pilot Valve	Bronze ASTM B584			1/4" NPT	

Valve Sizing

Proper valve selection requires the following information

- Steam capacity required for application
- Supply pressure of steam
- Allowable pressure drop across valve*

* Where it is not possible to calculate pressure drop, 35% - 40% of gauge supply pressure can be used as a reasonable approximation.

For capacities see page PTC-285.

Temperature Regulator Selection Example

Parameters:

Fluid Steam	
Maximum inlet pressure	7 bar
Outlet pressure	6 bar
Maximum flow rate	678 kg/h
Temperature required	82°C
Distance from regulator to sensing point.	1,5 m

To Locate Proper Model:

Enter inlet column at	7 bar
Move to outlet pressure of	6 bar
Locate capacity of 678 kg/h under	1"
Find capillary temperature range	55 - 94°C
Select capillary length	2 m or standard 5 m

Application Will Require:

OB-2000, 1" with 55 - 94°C Temperature Range,
Capillary Length 5 m

OB-2000PT

For Steam Service

The OB-2000PT is a diaphragm-operated externally piloted pressure/temperature combination regulator. It is used in applications where maximum pressure should be limited and the temperature of the heated medium is controlled using a single seated main valve.

Temperature pilot and capillary unit disconnect, making repairs or temperature range changes quick and easy. Available in sizes 1/2" through 4" and with a choice of four spring ranges, six temperature ranges and three capillary lengths.

Table PTC-284-1. OB-2000PT Specifications

Application	Inlet Pressure (barg)	Minimum Differential (barg)	Reduced Pressure (barg) Spring Color	Temperature Ranges (°C)	Temperature Accuracy (°C)	Capillary Length (m)
Steam	1 – 20	0,5	0,1 - 0,2 (yellow)* 0,2 - 1,4 (yellow) 1,0 - 14 (green)	-8 - 15 10 - 36 30 - 62 55 - 94 80 - 127 115 - 183	± 1°C From Set Point	2 3 5**

* When using this spring range, remove one (1) pilot diaphragm. Capacities are reduced by 1/2 of capacity chart when this spring is being used.

** Standard length

Table PTC-284-2. OB-2000PT Sensor and Accessory Specifications

CAPILLARY		BULB		THERMAL WELL	
Material	Temperature Range (°C)	Material	Connection	Material	Connection
Copper Capillary Tube with 304 Stainless Steel Armor Shield	-8 - 15	Nickel Plated Copper	3/4" NPT	Brass or 304 Stainless Steel*	1" BSPT
	10 - 36				
	30 - 62				
	55 - 94				
	80 - 127				
	115 - 183				

* Standard. Other material available upon request. See page PTC-280 for dimensional information.

Note: Capillary can withstand a maximum of 20°C above rated range. If desired set temperature is in temperature range overlap, select lower range.

Table PTC-284-3. OB-2000PT Dimensions and Weights

Size	Face-to-Face		H	H ₁	A	G	Weight		Cv
	BSPT	PN 25/40					BSPT	PN 25/40

* Minimum inlet pressure for OB-2000PT is 1 barg because of the pressure pilot.

OBK-2000

Pneumatic Temperature Pilot

A compact pneumatic temperature pilot with broad temperature ranges, the OBK-2000 can be remotely located away from the regulator valve, an advantage not available with a conventional capillary system.

Typical applications include instantaneous or storage tank water heaters, air make-up units and manufacturing process operations such as parts washing, die casting and plastic molding.

Capable of reverse or direct-acting operation, the OBK-2000 features a simple design with fewer moving parts for trouble free operation. Other features include supply and control pressure gauges, a rugged cast brass housing, and precise and rapid response to temperature changes. Brass, stainless steel bulbs and separate wells are available.

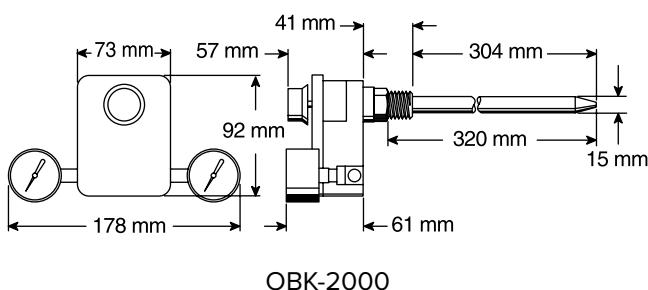

Table PTC-286-1. OBK-2000 Materials

Name of Part	Material
Body	Brass
O-rings	Silicone Rubber/Buna "N"
Valve	Phosphor Bronze
Valve Seat	Phosphor Bronze

Note: Thermal wells available (see page PTC-280). 304 stainless steel or brass are standard materials. Other materials available upon request.

Table PTC-286-2. OBK-2000 Specifications

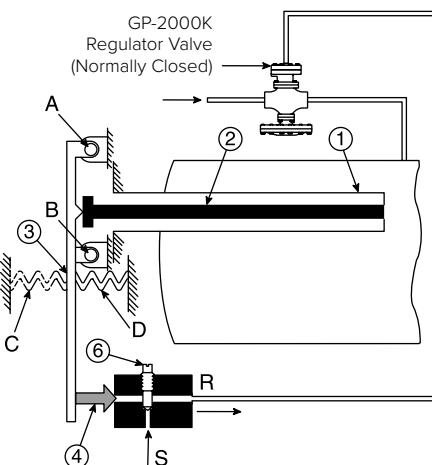

Dial adjustment range (°C)	Standard - 10 to 177
Maximum supply air pressure @ room temperature (barg)	2
Maximum air consumption (cm/s)	218 - 3
Maximum operating pressure (barg)	17
Maximum operating temperature (°C)	204
Temperature response (°C)	0,3
Mounting (mm)	15
Air connections (mm)	3
Shipping weight (kg)	1,8
Adjustable sensitivity (barg)	0,02 to 0,16
Maximum pressure on wells	
Stainless steel (barg)	79
Copper (barg)	36

Reverse-Acting Operation - For Heating

During operation, a temperature change in the medium being controlled creates a change in the length of the sensitivity tube. An increase in temperature lengthens the sensitivity tube (1) and moves the invar rod (2) from the lever (3). The lever pivots at point B and is moved so the exhaust valve (4) is opened by the spring at (D). This lever action decreases the supply air at point (S) in the control line at point (R) and closes the regulator valve. A decrease in temperature shortens the sensitivity tube at point (1) and moves the invar rod against the lever point (3). The lever at this point moves against the spring at point (D) to close the exhaust valve at point (4). This lever action increases the pressure in the control line at point (R) and opens the valve.

The sensitivity adjustment screw at point (6) regulates the rate of flow of the supply air to the controller to a change in temperature. Turning the screw clockwise increases the sensitivity by reducing the flow and increasing the response time. Turning the screw counterclockwise decreases the sensitivity by increasing flow and reducing the response time. Valve closes on air failure, making it fail-safe.

Operation Reverse Acting - For Heating

Positions A and C show pivot point A and spring C when controller is direct acting.

All dimensions and weights are approximate. Use certified print for exact dimensions. Design and materials are subject to change without notice.

OB-30, OB-2000, OB-2000PT

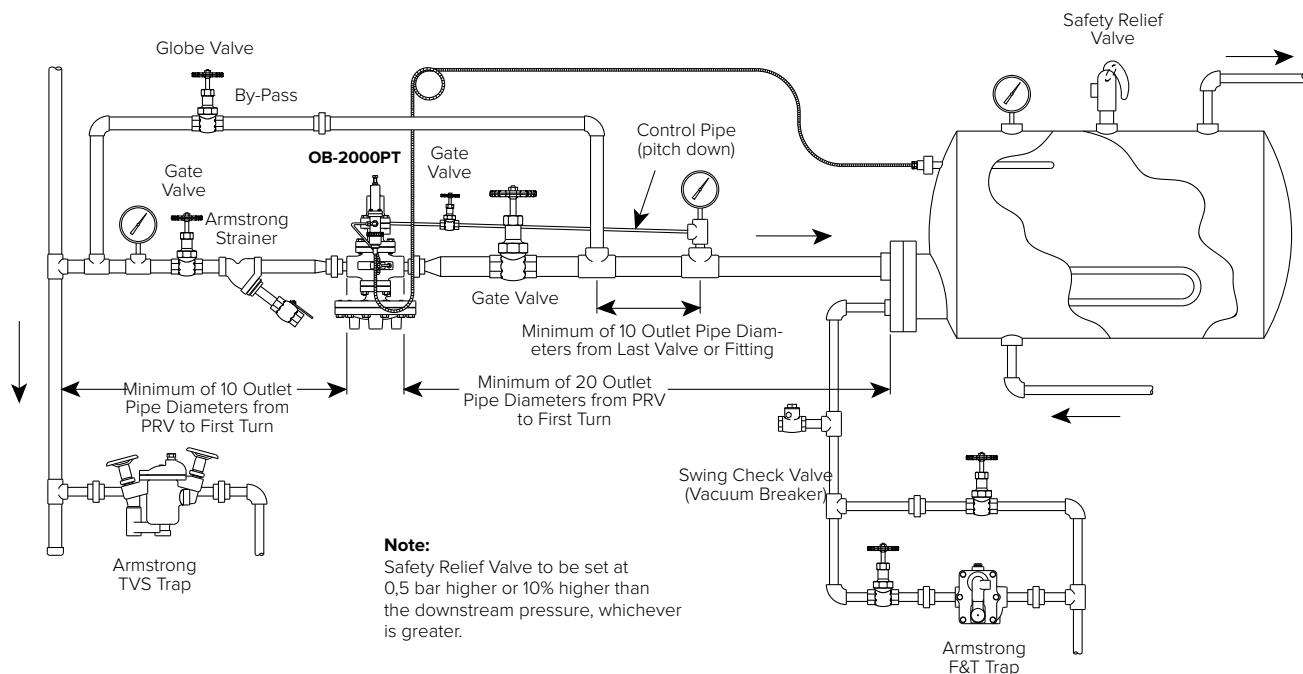

For Steam Service

Points to remember when installing:

- Drain condensate at inlet of pressure/temperature regulator with inverted bucket steam trap.
- Protect temperature regulating valve from dirt and scale by installing strainer with 100 mesh screen at inlet of valve.
- Install shutoff valves on either side of the regulating valve along with a by-pass line for maintenance purposes.
- Install vacuum breaker after the outlet of equipment and before the steam trap.

- Install sensor so it is fully immersed in the fluid being heated.
- If temperature well is used, apply heat transfer medium to sensor before insertion into well.
- Place thermometer into system in close proximity to temperature sensor for accurate valve adjustment.
- If possible, do not elevate condensate after steam trap.
- Determine pressure setting before temperature setting (OB-2000PT only).

Typical Installation - OB-30, OB-2000 and OB-2000PT

Steam Load Calculations

The calculation formulas for the steam load according to the application can be found in the Condensate Guidelines chapter.
